Connect to Azure Studio (Automatically)

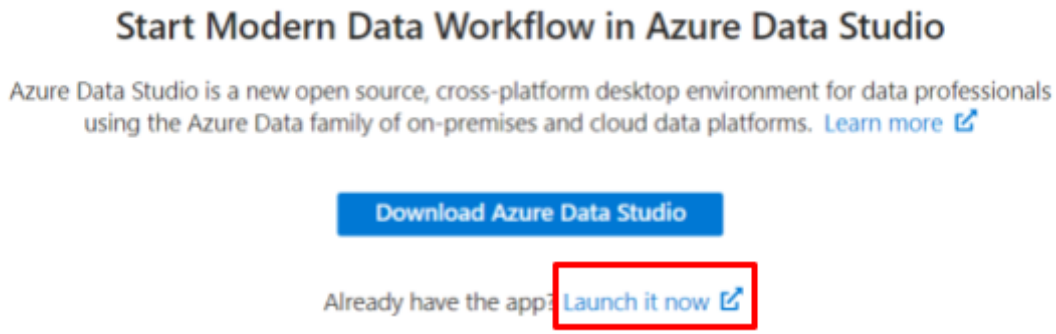

1. Select your database in Microsoft Azure

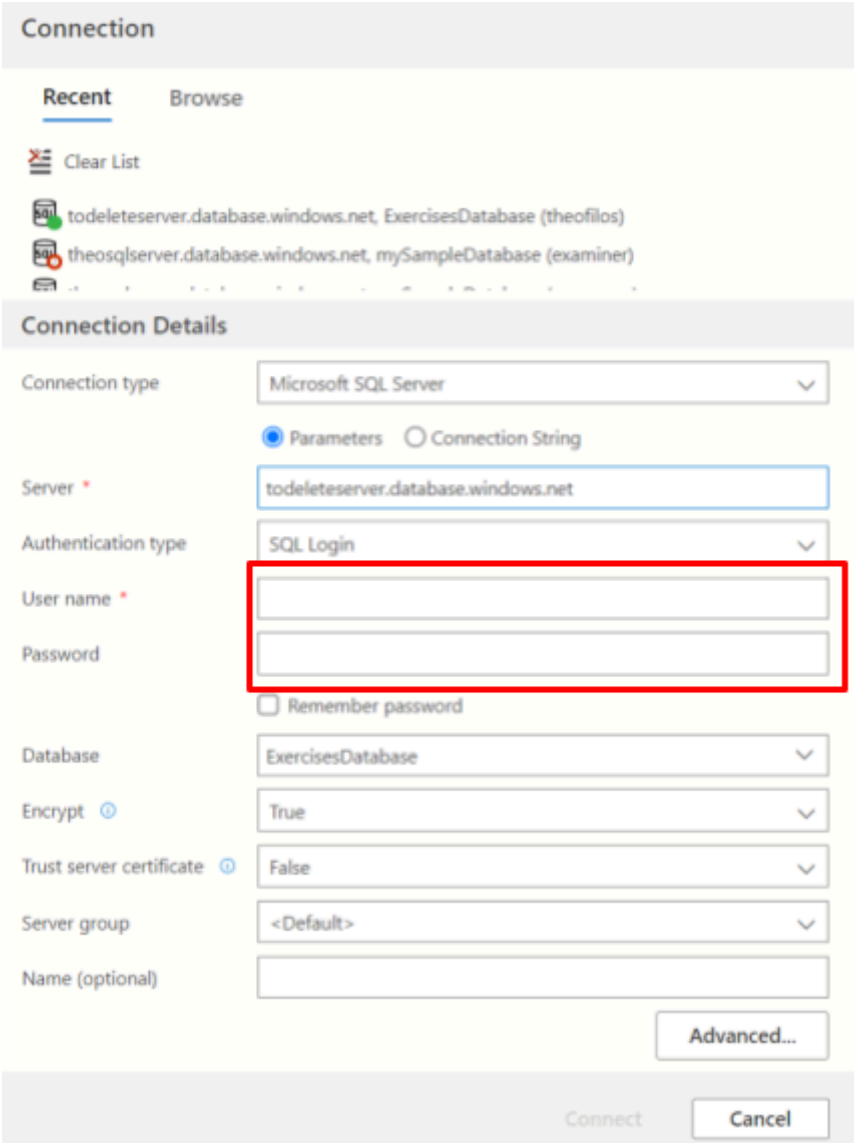

2. Go to the tab “Connect with Azure Data Studio”

3. Download and Install Azure Data Studio
4. Press “Launch it now”

5. In Azure studio enter user name and password (store the password) and press connect.

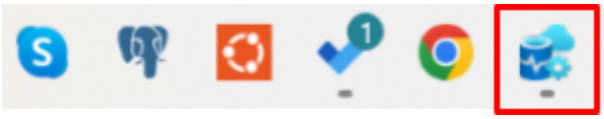

6. Now you can use your database.

Create Examiner User

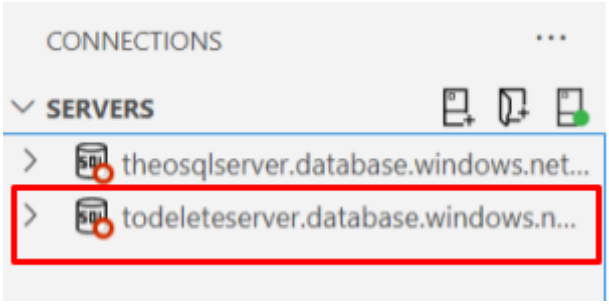

The examiner user should only have read-only access to your database.

1. Open Azure Studio

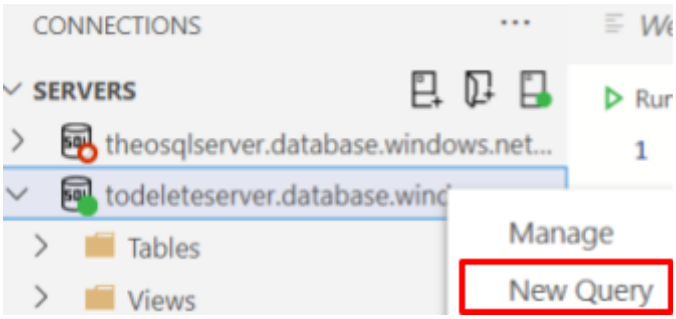

2. In Azure StudioQDouble

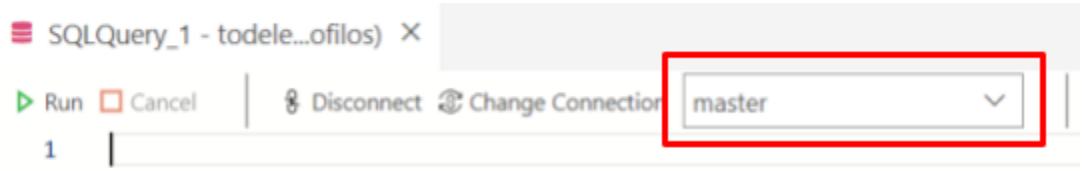

- Click your database server to connect (you should be connected as admin)

- Right Click on your database server and select New Query

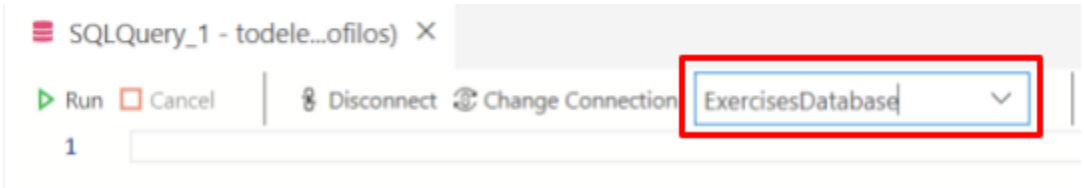

3. In the query tab:
   - Choose the **master** database

   - Run the following script choosing what the <u>examiner's password</u> will be

```
CREATE LOGIN examiner WITH PASSWORD = 'password';
CREATE USER examiner FROM LOGIN examiner WITH
DEFAULT_SCHEMA = dbo;
```

   - Choose the **target** database

   - Run the following script

```
CREATE USER examiner FROM LOGIN examiner
EXEC sp_addrolemember 'db_datareader', 'examiner';
```

4. There should be an examiner user

Verify the Creation of user Examiner

Method 1

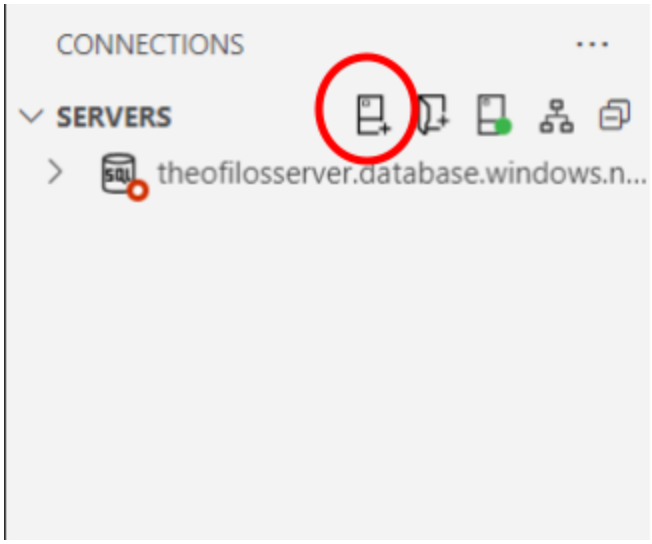

If sqlcmd appears as a terminal command, you can check that you can connect to the Azure database as an examiner using the sqlcmd command:

```
sqlcmd -S <server-url> -U examiner -P '<password>'
```

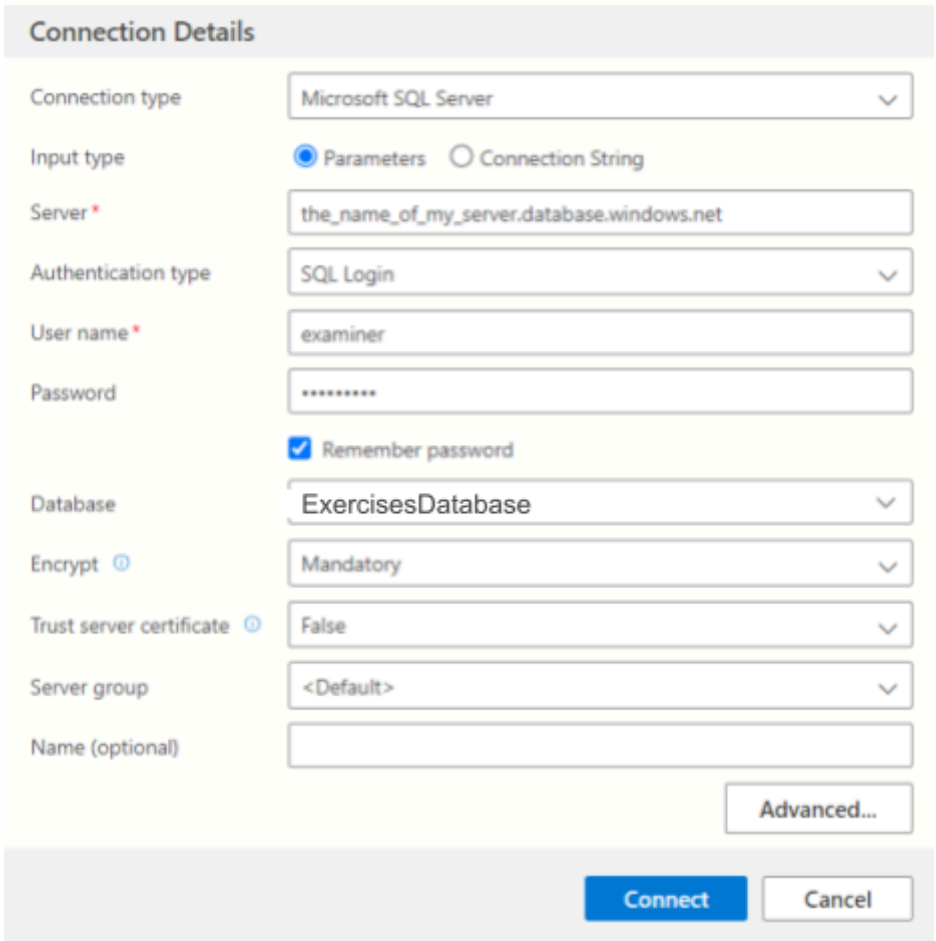

Method 2

Otherwise, you can verify the creation of the user examiner using Azure Data Studio.

- Create a new connection

- Complete the information as you did for the creation of the basic user, with the only difference being that you will enter the username and password for the examiner.

- Upon completion of the process, you will have two connections in Azure Data Studio.
